 - 2. Post-Development Drainage Area Map
 - 3. Inlet Drainage Area Map

I. INTRODUCTION

The proposed project, known as Stone Rise, will consist of a residential complex of twenty-one (21) residential buildings, parking and a club house. The project is located within the Township of Marlboro, Monmouth County, New Jersey. The project consists of five (5) lots (4, 10, 11, 12 & 13) within Block 111, all of which are proposed to be merged into a single lot. The subject property is bounded on the north by existing residential homes along Texas Road and on the south, east and west by existing wooded areas. The 34-acre site is currently developed with a wrecking yard, former homestead, the remains of which are present on site, and surrounding woods.

The site slopes to the east draining into wetlands that ultimately drains into a stream along the eastern property line. A combination of infiltration/detention basins and a bio-retention basin will be utilized to meet required flow rate reductions, water quality and recharge.

It is the purpose of this report to demonstrate the following:

- 1) Required flow reductions for the post-development condition will be obtained through the use of two (2) surface infiltration/detention basins. Infiltration rate will be assumed to be zero for the purposes of calculating runoff rates.
- 2) The project will meet required water quality and recharge standards for storm water runoff through the use of two (2) surface infiltration / detention basins and a bio-retention basin.

Methods of determining stormwater runoff and peak discharge follow the procedures as outlined in “Urban Hydrology for Small Watersheds”, Soil Conservation Service Technical Release No. 55, and NOAA 24-hour rainfall data for Monmouth County for each storm event studied. Stormwater hydrographs were performed using HydroCAD Software Solutions’ “HydroCAD” (ver. 10.00-24) computer program.

The following 24-hour storm events were studied using a NOAA Point Precipitation Frequency Estimate, 24-hr D Storm distribution. The rainfall intensities are based upon NOAA Point Precipitation Frequency estimates:

Storm Frequency (Years)	Rainfall (Inches)
2	3.4
10	5.2
25	6.4
100	9.8

II. PRE-DEVELOPMENT CONDITIONS

A summary of the previously discussed drainage areas for the pre-development condition follows below. Refer to the Appendix B for accompanying Hydrograph calculations and Appendix H for the Pre-Development Drainage Map.

PRE-DEVELOPMENT

Total Analysis Area: 17.1 Acres

Watershed A

- | | |
|-------------------|--|
| Subarea A1 | Pervious Drainage Area that is tributary to the stream along the eastern property line.:
12.0 acres |
| Subarea A2 | Gravel / Concrete coverage Drainage Area that is tributary to the stream along the eastern property line:
5.1 acres |

III. POST DEVELOPMENT CONDITIONS

A summary of the previously discussed drainage areas for the post-development condition follows below. Refer to the Appendix C for Hydrograph calculations Appendix I for the Post-Development Drainage Map.

POST-DEVELOPMENT

Watershed A

Subarea A1i:	Impervious Drainage Area tributary to infiltration/detention Basin A: 6.4 acres
Subarea A1p:	Pervious Drainage Area tributary to infiltration/detention Basin A: 3.6 acres
Subarea B1i:	Impervious area tributary to Bio-Retention Basin B1: 1.6 acres
Subarea B1p:	Pervious area tributary to Bio-Retention Basin B1: 0.6 acres
Subarea B2i:	Impervious area tributary to the infiltration/detention Basin B2: 1.3 acres
Subarea B2p:	Pervious area tributary to infiltration/detention Basin B2: 1.9 acres
Subarea Ui:	Impervious area directly tributary to adjacent wetlands and stream: 0.2 acres
Subarea Up:	Pervious area directly tributary to adjacent wetlands and stream: 1.5 acres

IV. STORMWATER MANAGEMENT SUMMARY:

Pre- and Post-development computations for the resultant hydrographs, routing computations, and runoff volumes are appended, respectively, to this report. For each drainage area, the following summaries were generated:

Watershed A

Pre-development (17.1 ac)
Post-Development: (17.1 ac.)

Design Storm Frequency (Year)	Pre- Development Peak Flow (Total) (A) (cfs)	NJDEP Reduction Factor	Total Allowable Post Development Flow (cfs)	Post- Development Peak Flow (cfs)	Difference (cfs)
2	7.5	0.50	3.7	3.5	-0.2
10	15.5	0.75	11.6	9.7	-1.9
100	37.7	0.80	30.1	29.0	-1.1

The above calculations and proposed stormwater management design demonstrate that the post-development flows from the developed site will be reduced as required in the 2, 10 and 100-year storm events.

V. WATER QUALITY DISCUSSION

NJDEP Stormwater Management rules require that major developments provide 80% TSS reduction for post development runoff. We are proposing to construct a surface infiltration/detention basin A and a Bio-Retention Basin B1 to infiltrate the water quality storm event to meet the 80% TSS requirement. The calculations also show that infiltration and bio-retention basin completely evacuate within 12 hours. Please refer to Appendix D for Water Quality Calculations.

VI. GROUNDWATER RECHARGE DISCUSSION

Per these regulations, the project meets the definition for *Major Development*, and must therefore comply with Section 22-535.4.f.1.(b)(1)[b].

Demonstrate through hydrologic and hydraulic analysis that the increase of stormwater runoff volume from preconstruction to post-construction for the 2-year storm is infiltrated.

The table below demonstrates the total two-year design storm runoff volumes in both the pre and post development condition, as well as the total volume of runoff that is infiltrated via the use of the subsurface infiltration/detention basin and bio-retention basin.

PRE-DEVELOPMENT vs. POST DEVELOPMENT VOLUME

COMPARISON CHART (2-YEAR DESIGN EVENT)

WATERSHED A

Design Storm Frequency	(A) Predevelopment Runoff Volume (ac-ft)	(B) Post Development Runoff Volume (ac-ft)	Volume Required To Be Infiltrated (B – A) (ac-ft)	Volume Infiltrated Through Basin Bottom (ac-ft)
2-Year	0.58	2.51	1.93	2.25

As demonstrated above, the volume infiltrated exceeds the volume required by regulations. The calculations also show that infiltration and bio-retention basin completely evacuate within 26 hours for a 2-year storm event. Please refer to Appendix D for Water Recharge Calculations.

VII. EMERGENCY SPILLWAY CALCULATIONS

Portions of the embankments of the detention basins are considered Class IV dams according to NJDEP Dam Safety regulations. In accordance with requirements, the emergency spillways are designed to convey a rainfall 50% greater than a 24-hour, 100 year, NOAA Type D Storm, with the principal spillway clogged. The top of the dams have

been set to be over 1 foot above the emergency spillway flood elevation to meet Class IV dam requirements. Please refer to Appendix E for Emergency Spillway Calculations.

VIII. LOW IMPACT DEVELOPMENT DISCUSSION

The proposed low impact design has addressed the following non-structural stormwater management strategies.:.

7:8-5.3(b)(2): The design has decreased the amount of impervious area well below the ordinance allowable limits and has limited the parking to the ordinance requirements.

7:8-5.3(b)(8): We have disconnected impervious area along the southwest parking area that allows the runoff over the vegetated embankments of the bio-retention basin.

IX. CONCLUSION

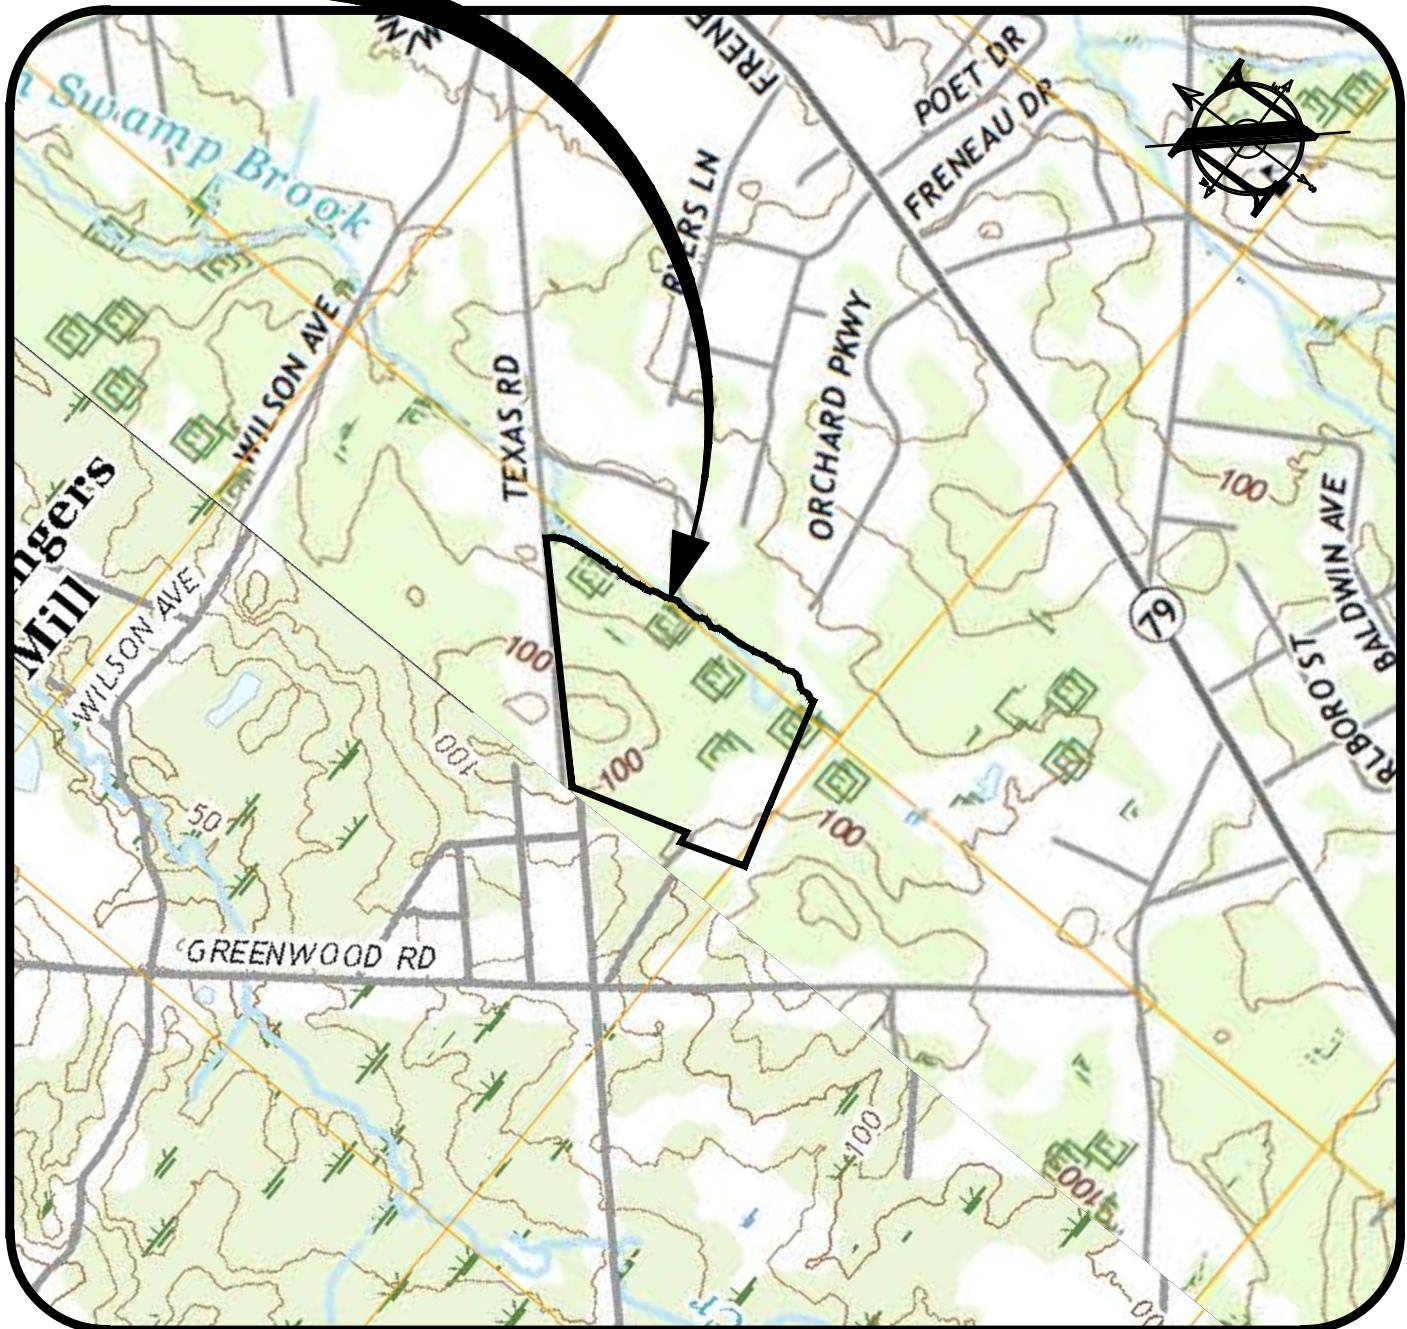

In conclusion, the project overall will comply with the storm water management requirements of the New Jersey Department of Environmental Protection and the Township of Marlboro for storm water rate reductions, water quality and recharge.

Tier A- Major Development Stormwater Summary

Attachment D – Major Development Stormwater Summary

General Information

1. Project Name:			
2. Municipality:	County:	Block(s):	Lot(s):
3. Site Location (State Plane Coordinates – NAD83):	E:	N:	
4. Date of Final Approval for Construction by Municipality:			
Date of Certificate of Occupancy:			
5. Project Type (check all that apply):			
Residential	Commercial	Industrial	Other (please specify) _____
6. Soil Conservation District Project Number:			
7. Did project require an NJDEP Land Use Permit?	Yes	No	Land Use Permit #:
8. Did project require the use of any mitigation measures?	Yes	No	If yes, which standard was mitigated? _____

Site Design Specifications

1. Area of Disturbance (acres):	Area of Proposed Impervious (acres):		
2. List all Hydrologic Soil Groups:			
3. Please Identify the Amount of Each Best Management Practices (BMPs) Utilized in Design Below:			
Bioretention Systems _____	Constructed Wetlands _____	Dry Wells _____	Extended Detention Basins _____
Infiltration Basins _____	Combination Infiltration/Detention Basins _____	Manufactured Treatment Devices _____	
Pervious Paving Systems _____	Sand Filters _____	Vegetative Filter Strips _____	Wet Ponds _____
Grass Swales _____	Subsurface Gravel Wetlands _____	Other _____	

Storm Event Information

Storm Event - Rainfall (inches and duration):	2 yr.: _____	10 yr.: _____
	100 yr.: _____	WQDS: _____

Runoff Computation Method:

NRCS: Dimensionless Unit Hydrograph NRCS: Delmarva Unit Hydrograph Rational Modified Rational
Other: _____

Basin Specifications (answer all that apply)

If more than one basin, attach multiple sheets

1. Type of Basin:	Surface/Subsurface (select one): Surface Subsurface		
2. Owner (select one):	Public	Private: If so, Name: _____	Phone number: _____
3. Basin Construction Completion Date:			
4. Drain Down Time (hr.):			
5. Design Soil Permeability (in./hr.):			
6. Seasonal High Water Table Depth from Bottom of Basin (ft.):	Date Obtained: _____		
7. Groundwater Recharge Methodology (select one):	2 Year Difference	NJGRS	Other
8. Groundwater Mounding Analysis (select one):	Yes	No	If, Yes Methodology Used: _____
9. Maintenance Plan Submitted:	Yes	No	Is the Basin Deed Restricted: Yes No

Comments:
